Shipping Weight (Gross)	100.48 kg

The twin heads of the SD-60A Horizontal Brush Sander are equipped with different grades of abrasive paper for the industrial application of sanding solid wood, allowing for two distinct finishing results.

In woodworking applications, brush sanders are commonly used for final sanding and finishing of wooden surfaces. They can remove minor imperfections, smooth out grain patterns, and create a uniform surface before applying finishes like varnish or paint.

Features

Variable Speed Control: Brush sanders with variable speed settings allow you to adjust the rotation speed of the drum or cylinder. This feature enables you to optimize the sanding process based on the material, desired finish, or specific requirements of your project.
