Features:

135° Split Point (crankshaft point)

Split point is self centering and the short distance from the drill axis to the outer corners results in faster penetration, reducing end thrust

The 135° point should be used to cut harder steel materials especially in deep hole applications

In these situations it will produce thicker chips minimising work hardening of the cavity

Faster penetration reduces abrasion and friction along the cutting edges.

Suitable for:

General purpose use drilling in metal, timber, plastics, and a wide variety of other materials
